Lateral magnet offset (will cause additional linearity error):

The maximum error which is caused by lateral offset between sensor and position marker can be approximated as follows:

$$\text{Error [}^\circ\text{]} = \text{magnet constant} \times (\text{offset [mm]})^2$$

The magnet constant depends on the position marker.

Example: Z-RFC-P02:

magnet constant = 0.8° /mm²;

offset = 0.5 mm

$$\text{Error [}^\circ\text{]} = 0.8^\circ/\text{mm}^2 \times (0.5 \text{ mm})^2 = 0,2^\circ$$

Mounting instructions Z-RFC-P03 / Z-RFC-P04

- If the shaft is magnetizable please keep sufficient distance
- When the magnet is mounted in the shaft, the shaft may not be magnetizable
- If the magnet is axially fixed on a magnetizable shaft the working distances reduces by approximately 20 %
- In general, we recommend mounting on not magnetizable materials, otherwise the stated working distances can change.
